

Oscillating Circuits

We have seen some original OC (Oscillating Circuits) and some which are probably constructed by Vassilev.

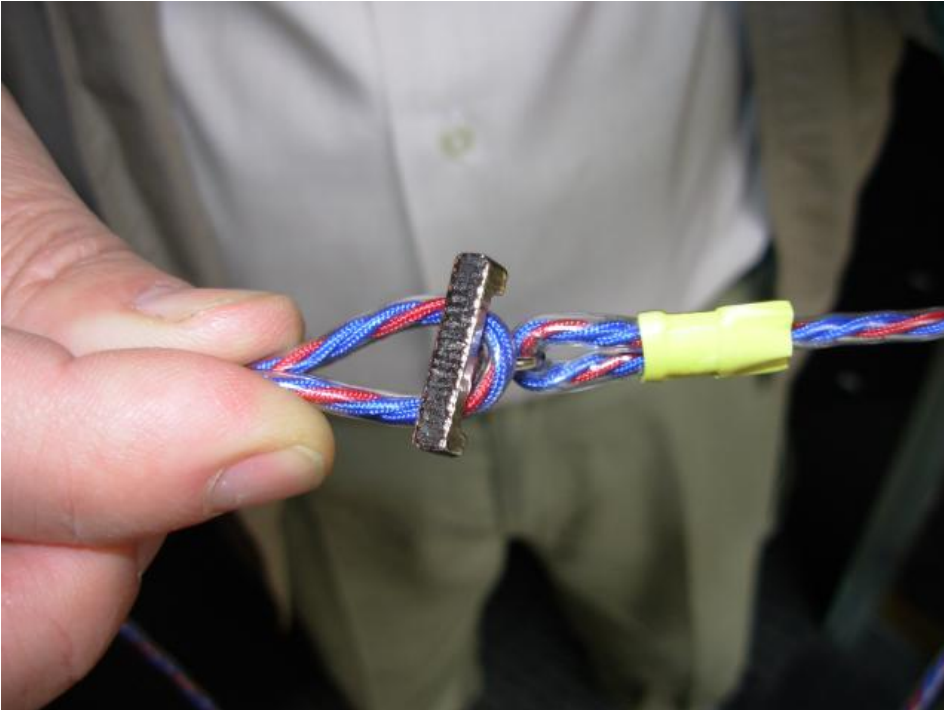

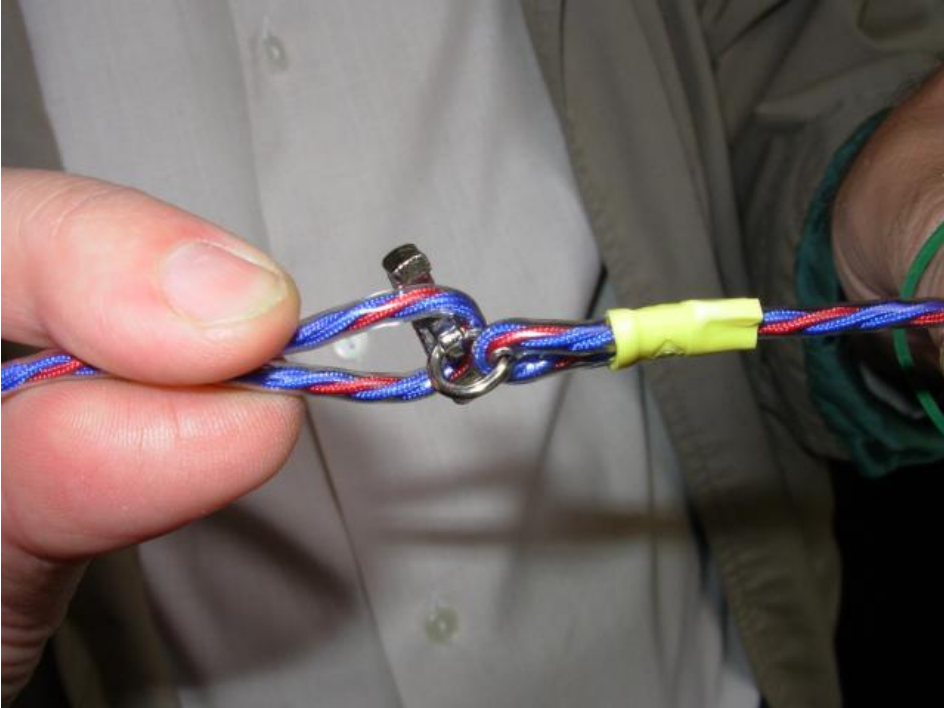

The original OC were still in the container together with an “How to use” guide.

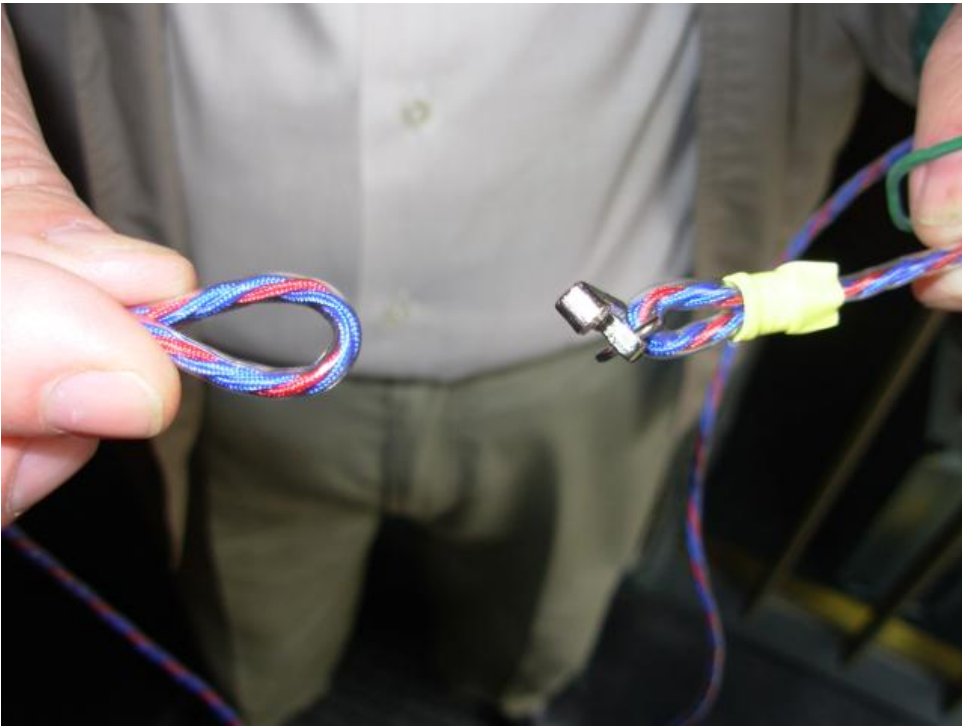

Guide:

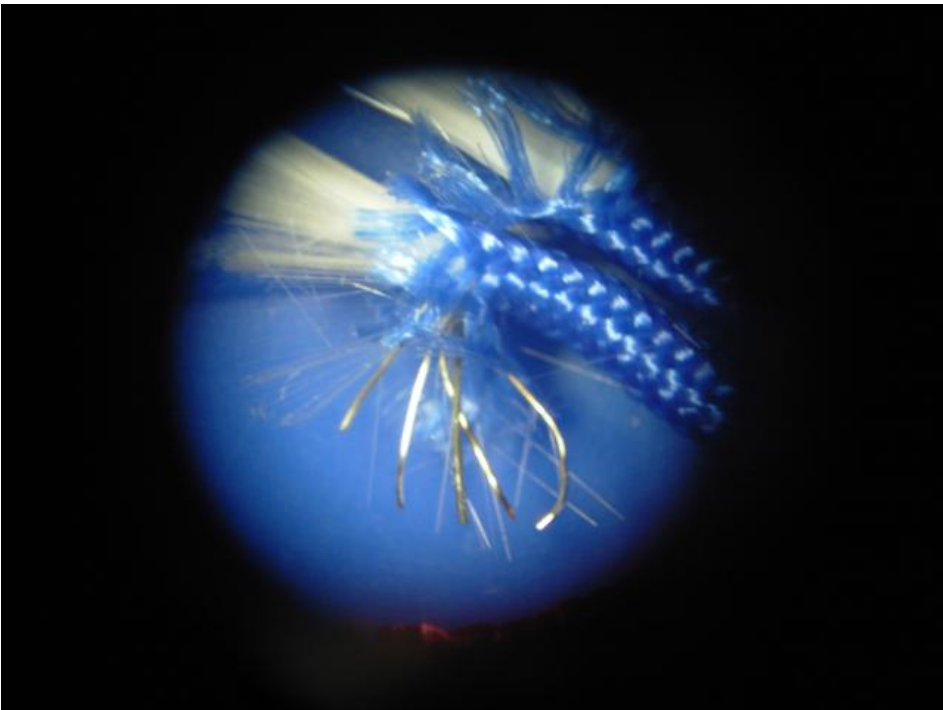

1. Position the ends to the bottom side
2. Change every other day the direction of the OC

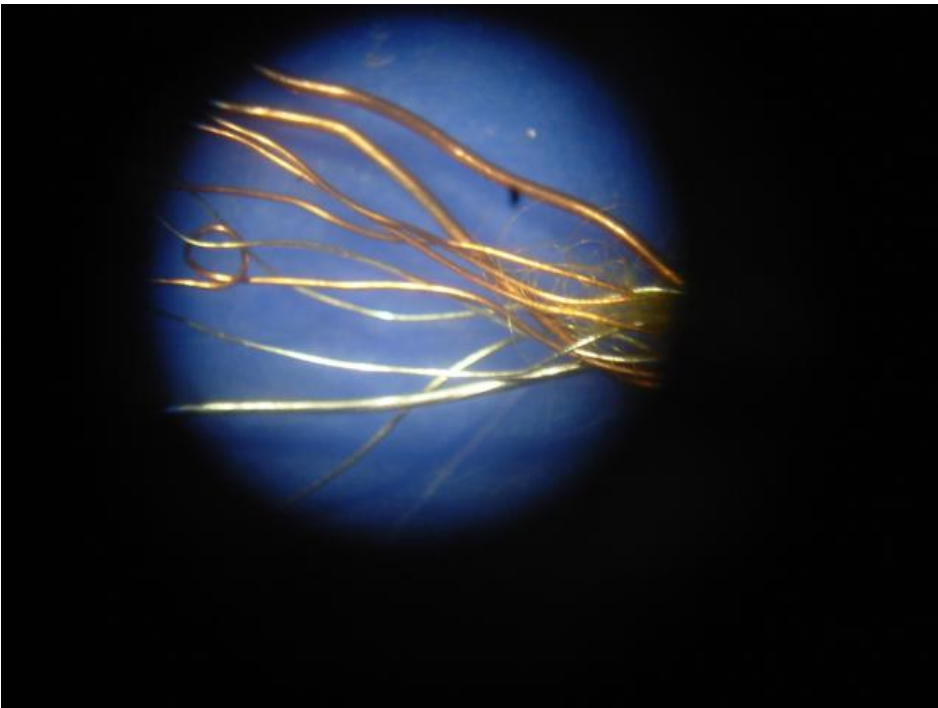

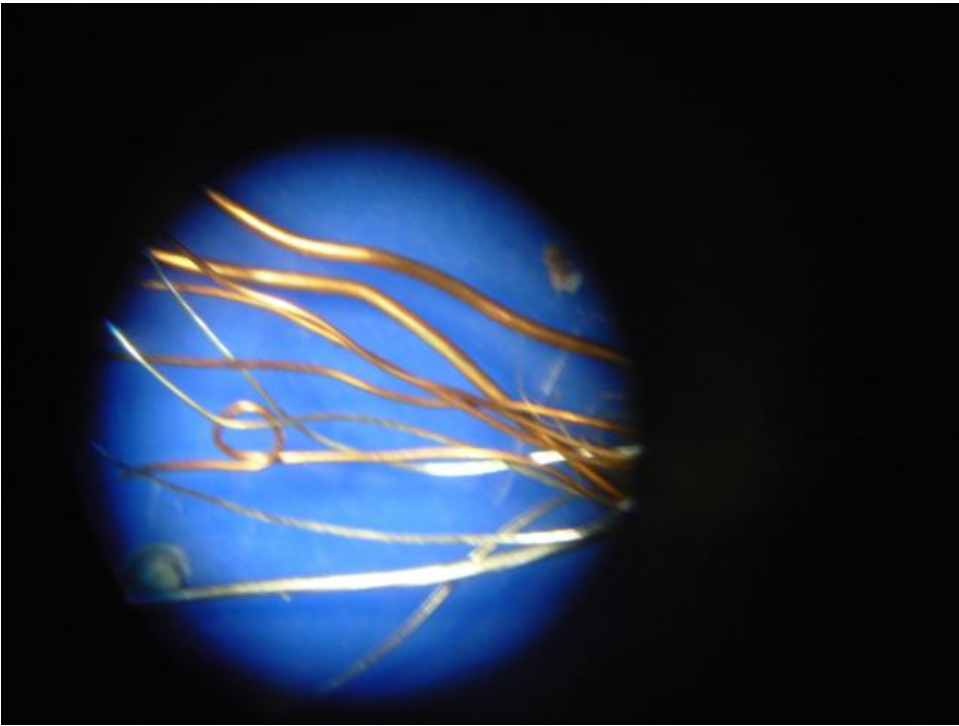

The model below is believed to be original

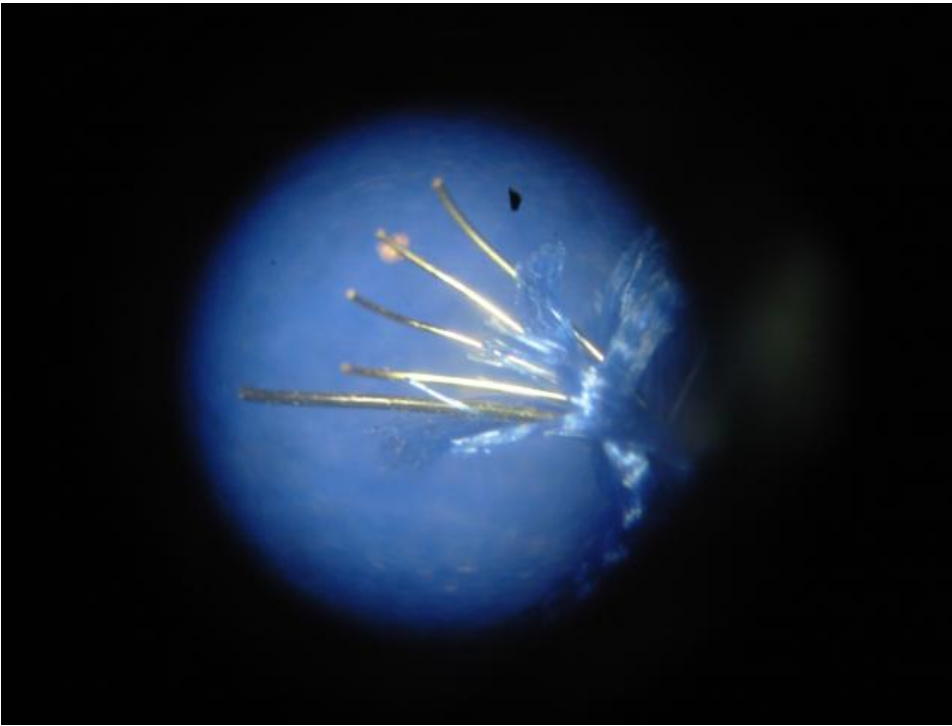

There are 11 conducting wires inside which are from different metals. Between the wires is no electrical isolation. It is believed that Galvani has information about the materials.

The blue OC in the picture below can be original but most likely from Vassilev. It is indictaed B.V. Lakovsky. And is also constructed from multi wires.

Dimensions:

1. smallest one: did not measure; for the arm
2. middle size: 74 cm; for the neck
3. Long size: 90 cm; for the waist

This is a 74 cm OC
